PCT: The abbreviation PCT stands for a number of things including porphyria cutanea tarda, literally, the tendon skin form of porphyria, a genetic photosensitive (photosensitive) skin disease with onset in adulthood with substances called uroporphyrins in the urine due to a lack of uroporphyrinogen decarboxylase (UROD), an enzyme required for the synthesis of heme (part of hemoglobin, the pigment in red blood cells that carry oxygen). The hallmarks of porphyria cutanea tarda (PCT) are blisters that become ulcerated in areas of the skin exposed to sunlight, especially on the face, ears and dorsum (back) of the hands. The affected areas of the skin also tend to be fragile and show hyperpigmentation (excess pigment) and hypertrichosis (excess hair). PCT, the most common form of porphyria, is found in two clinical familial and one sporadic form: The familial form of PCT - inherited as an autosomal dominant trait with men and women affected for several generations. The enzyme UROD is reduced in all tissues. The sporadic form of PCT - is more common. The enzyme UROD is reduced only in the liver. It appears sporadically in people with liver disease, as from alcoholism, and from exposure to agents such as estrogens. Iron overload is often present in PCT and may be associated with varying degrees of damage to the liver. A severe form of PCT, hepatoerythropoietic porphyria (HEP), has its onset in infancy with accumulation of protoporphyrin in the red blood cells. The level of the enzyme UROD is very low in red cells. The UROD gene has been mapped to 1p34. Mutations have been identified in the UROD gene, including DNA base substitutions and deletions. These mutations result in reduced activity of the enzyme. Some mutation result in PCT and others in the recessively inherited HEP. HEP is the homozygous form of familial PCT. Treatment is directed first at reducing iron overload of regular phlebotomy (removal of blood). Then, treatment with the drug chloroquine usually provokes rapid remission which is persistent while chloroquine is continued in regular low doses. What causes tooth decay? See Answer
